Pfizer

Dear Hiring Manager,

Two years ago, I supported Pfizer's AI/ML/Analytics Enterprise Architecture team, prototyping the vector database and RAG scaffolding that other teams later built on. What stuck with me was not the architecture itself, but how much of the actual job was translation: sitting with commercial and clinical stakeholders, understanding what they actually needed, and making sure the AI and cloud foundation underneath could support it before anyone got attached to a demo.

I have spent the two years since doing a version of that same job from the business side of the table. At Mondelez, I work inside the commercial organization (Marketing, Insights, and Revenue Growth Management), helping those teams find and adopt the right AI and cloud tools, then partnering with MLOps so the resulting proof-of-concepts sit on infrastructure that actually holds up. The pattern is the same either way: a business team has an idea, and someone has to make sure the AI and data foundation gets built underneath it quickly and correctly, not after the fact. That is exactly the kind of bridge this role is built around, and it is the part of the job I find genuinely interesting rather than just necessary.

I would like to bring that instinct, plus the Pfizer-side view of how enterprise AI infrastructure actually gets built, back into a role built around exactly that kind of translation. I would welcome the chance to talk more about what your team is building.

Best,

Franklin Fuchs
