EDUCATION

Johns Hopkins University **2021 – 2023**
MS in Biostatistics

University of Nevada, Reno **2017 – 2021**
Honors BS in Mathematics (Statistics Emphasis), Minor in Big Data

SKILLS

- **Agentic Development Environments:** Kiro, GitHub Copilot
- **Programming Languages:** Python, SQL, R, C++, C, MATLAB
- **Software:** GCP, AWS, Databricks, BigQuery, NielsenIQ Discover (POS & Panel Data), Dataiku, Tableau, Power BI, Snowflake, Docker, Singularity, SLURM, Markdown, Shiny, LaTeX, Linux Shell, Office Suite, Git, and GitHub
- **Modeling and Computing:** Multi-Objective Optimization, Classification, Regression, Retail Price Elasticity Modeling, Time Series Forecasting, Predictive Analytics, Feature Engineering, Data Wrangling, Variable Selection, Exploratory Data Analysis, Data Web-App Development, Database Design, Interactive Data Visualization, LLM Infrastructure Development

WORK

Mondelez Insights and Analytics Group **Jun. 2025 – Present**
Business Intelligence, Forecasting & *Data Science Manager* ← *Data Science Manager*

- Bridge Marketing, Insights, and Digital stakeholders with Mondelez's internal AI and cloud infrastructure, guiding teams to the right tools through presentations and enablement sessions and partnering with MLOps on best practices, so business-driven AI ideas reach proof-of-concept on solid compute and storage foundations quickly.
- Built and validated GCP-native price elasticity models for the Bars and Candy portfolios with Revenue Growth Management (RGM), internalizing work previously outsourced to NielsenIQ to eliminate ~$275K/year in vendor spend while enabling more granular, PPG-level elasticity tracking.
- Built a Streamlit-based synthetic matching tool giving brand teams a self-serve way to optimize Oreo in-store placement, using KNN store matching, ANOVA testing, and multi-source retail data on pricing, promotion, and product strategy.
- Informed category strategy by quantifying the impact of GLP-1 medication adoption on our total (snacking) product portfolio, integrating prescription claims, Nielsen retail sales, and macroeconomic data across 9 U.S. Census Divisions; cohort decay and Explainable Boosting Machine (EBM) models isolated GLP-1 as a statistically significant but secondary headwind.
- Recommended portfolio adjustments to maximize marginal revenue per marginal TDP change by developing an Elastic Net model quantifying halo dollar impact of the LTE Oreo portfolio ($150M revenue) on total Oreo brand revenue ($2.4B) over 2.5 years, using shrinkage methods for multicollinearity and variable selection across Economic, Panel, Price, Promotion, Distribution, and Category data.

Pfizer AI, Data, Analytics, Digital Health Architecture Groups **Jun. 2023 – Jun. 2025**
Data Scientist ← *Software/Solution Engineer (Rotational Associate)*

- Created static and time-dependent recommender/ranking systems for Target Product Profile Benefit-Risk Modeling using Multi-Objective Optimization (Evolutionary Algorithms, Reinforcement Learning, Robust Portfolio Optimization) in Python and R.
- Designed interactive visualizations highlighting unmet needs across demographic patient groups and diseases, using SQLite/MS SQL Server for storage, AWS for deployment, and custom HTML/CSS for UI styling.
- Enhanced internal Python data APIs with LLM/Chatbot capabilities for accelerated data ingestion, building RAG systems with source citation and tabular dataset generation using specialized LLM-based agents.
- Conducted Non-Parametric Statistical Modeling to support indication expansion of current portfolio drugs, integrating efficacy, safety, viability, and patient preference data.
